# Immuno-Oncologia: verso una immunoterapia di precisione?

**Anna Maria Di Giacomo**

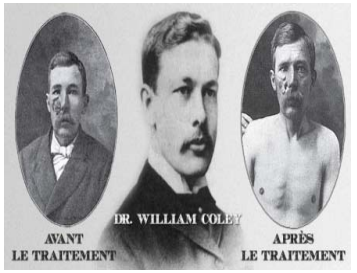
Medical Oncology and Immunotherapy
Center for Immuno-Oncology
SIENA, ITALY

# Cancer immunotherapy, a very long standing concept

The concept that a vaccine could be useful in the treatment of cancer is a long-held hope coming from the observation that patients with cancer who developed bacterial infections experienced remission of their malignancies.

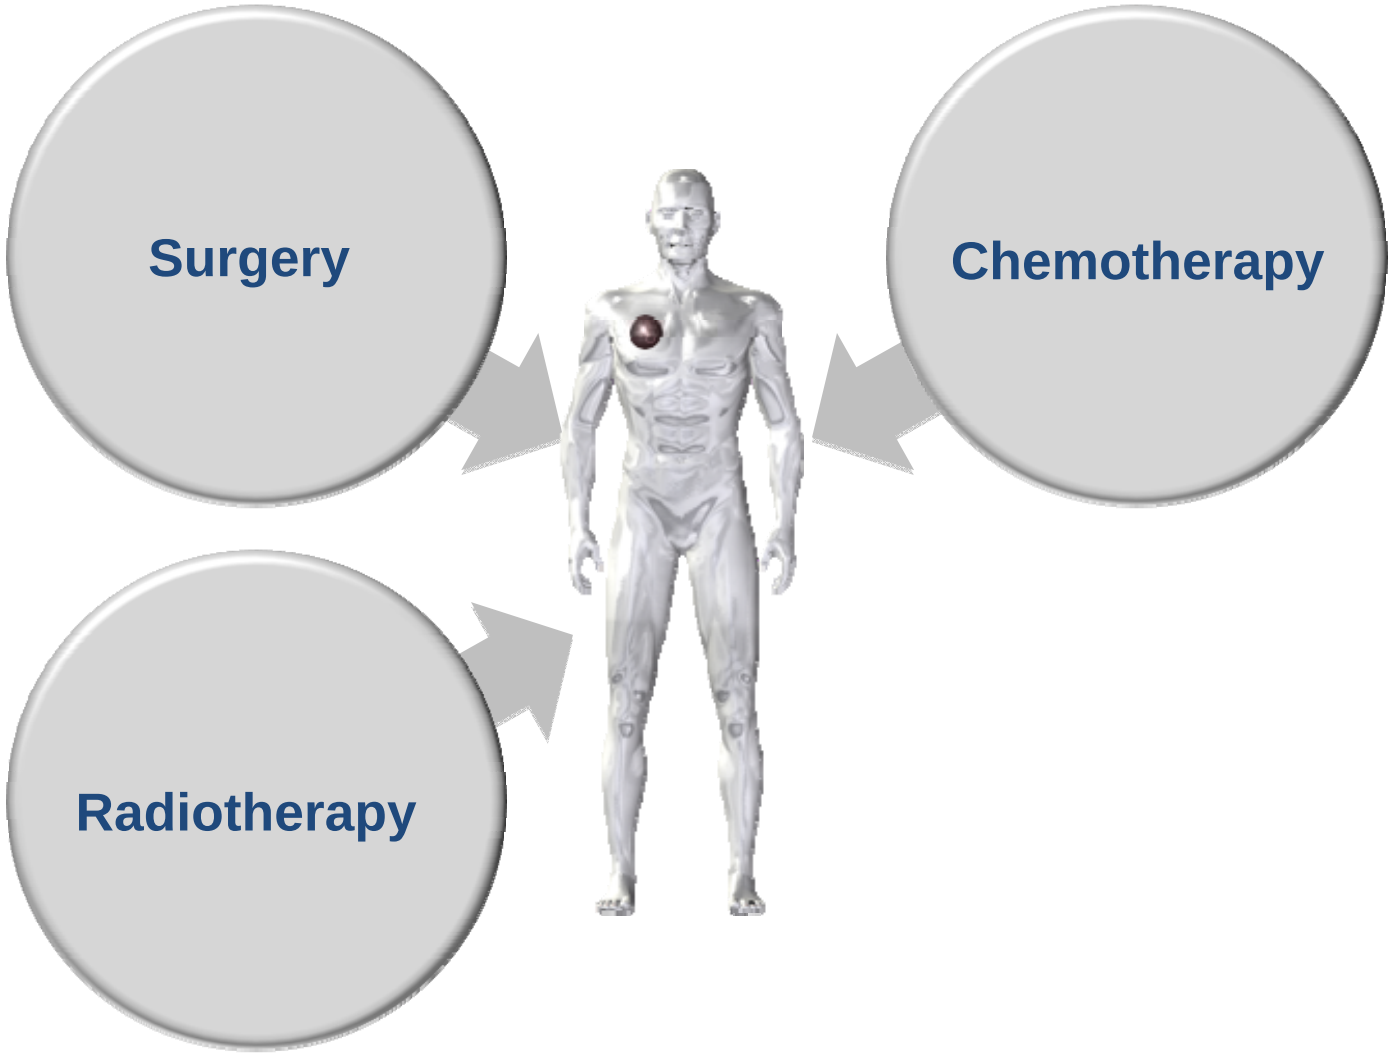
The earliest mention of cancer-fighting infections dates to a citation from Ebers papyrus (1550 B.C.) attributed to the Egyptian physician Imhotep (2600 B.C.), who recommended to treat tumors (swellings) with a poultice followed by an incision which would result in infection of the tumor and therefore its regression.

In 1896, the surgeon William Coley locally injected streptococcal broth cultures to induce erysipelas in an Italian patient (Mr. Zola) with an inoperable neck sarcoma, obtaining a tumour regression. Although therapy was toxic, the patient's tumour ultimately regressed, and he lived disease-free for 8 years before succumbing to his cancer.

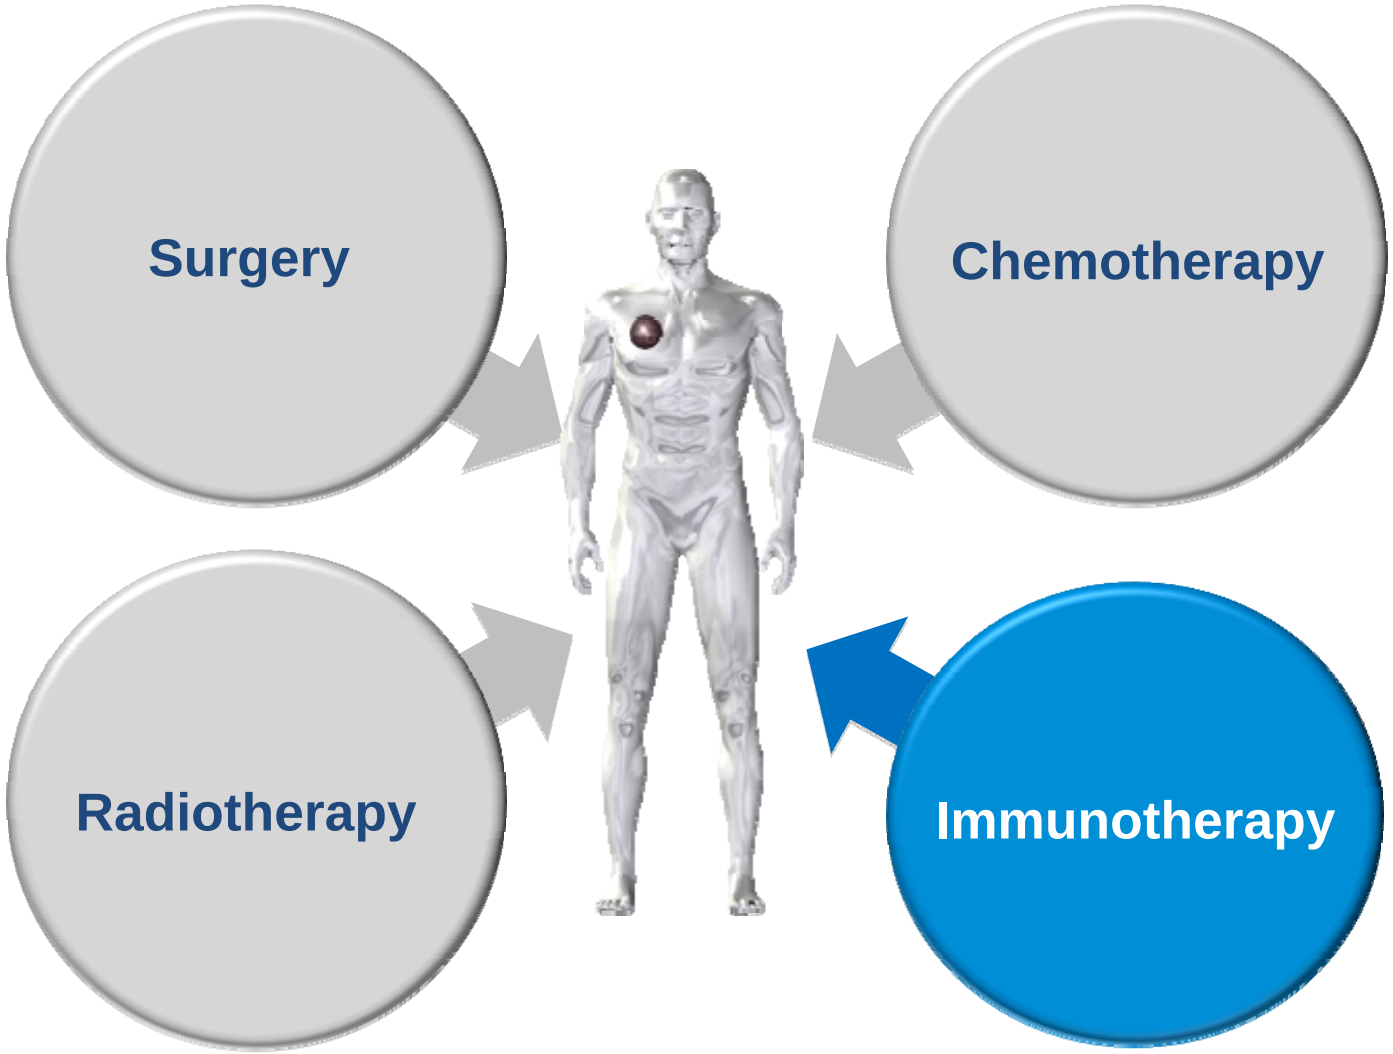


Venuti A. J Exp Clin Cancer Res. 2009.

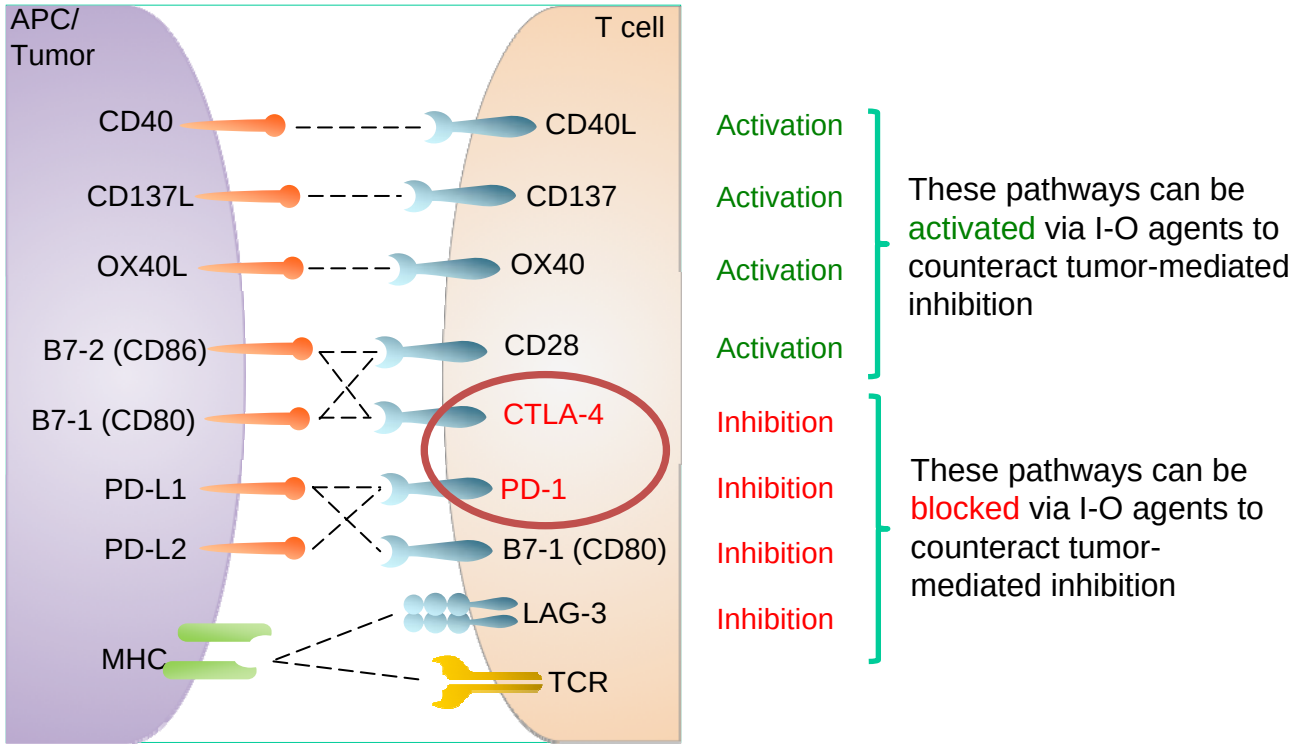
# Evolving Therapeutic Options for Cancer Treatment



# Evolving Therapeutic Options for Cancer Treatment



# T-cell Checkpoint and Co-stimulatory Pathways



Adapted from Pardoll DM 2012.

APC=antigen-presenting cell; CTLA-4=cytotoxic T-lymphocyte antigen-4; LAG-3=lymphocyte activation gene-3; MHC=major histocompatibility complex;
PD-1=programmed death-1; PD-L1=PD ligand-1; PD-L2=PD ligand-2; TCR=T-cell receptor.

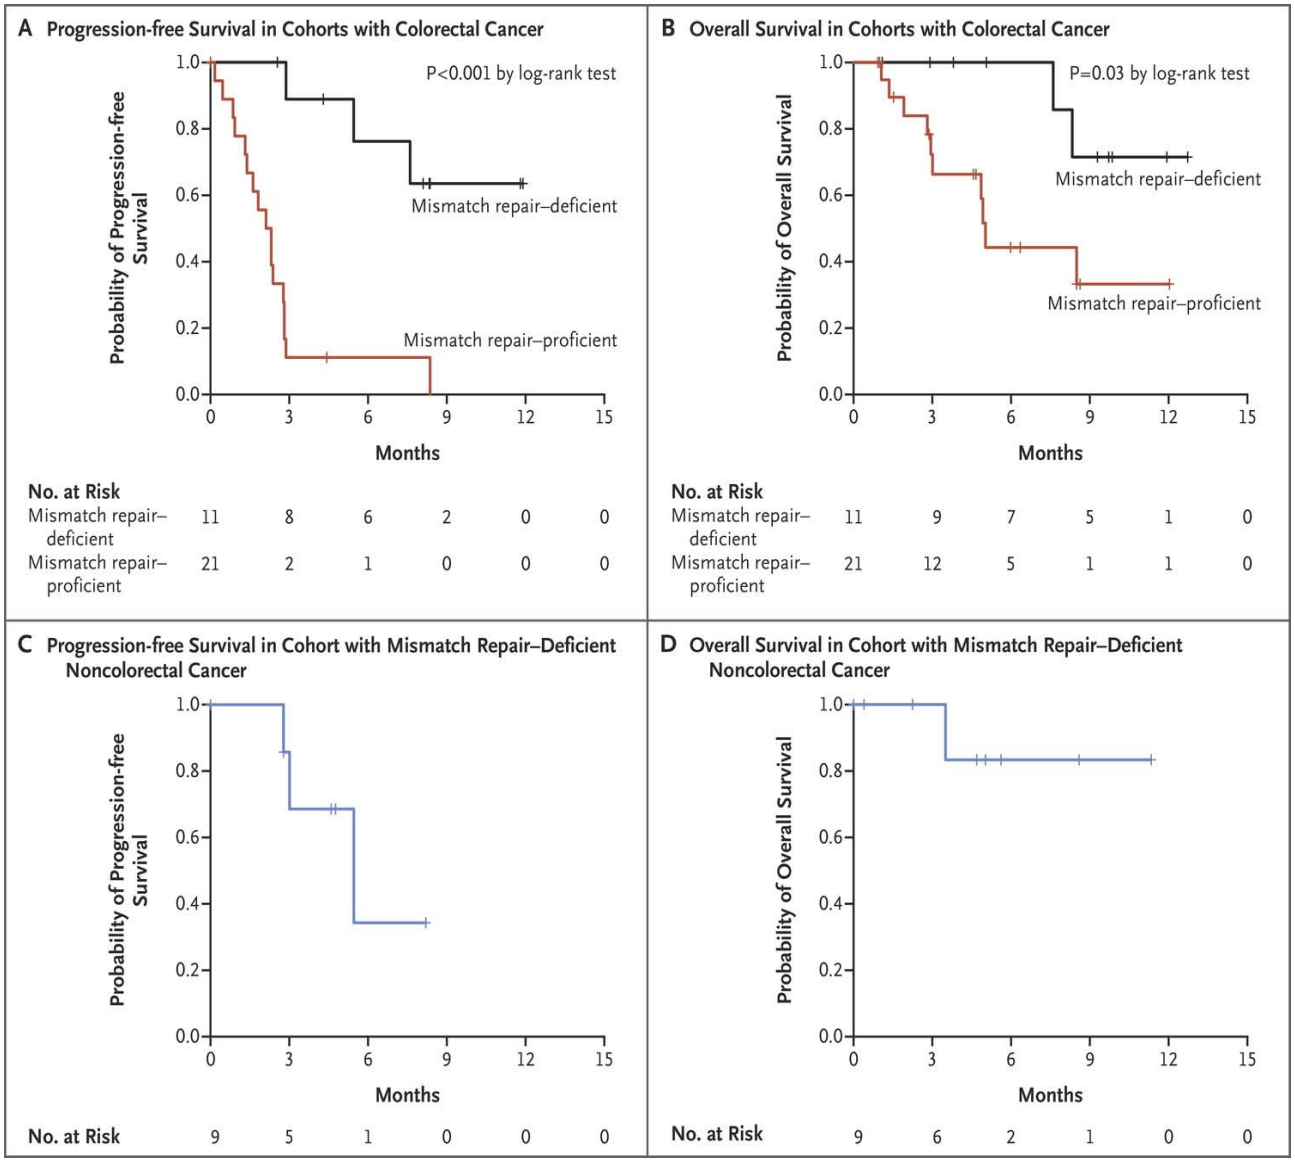
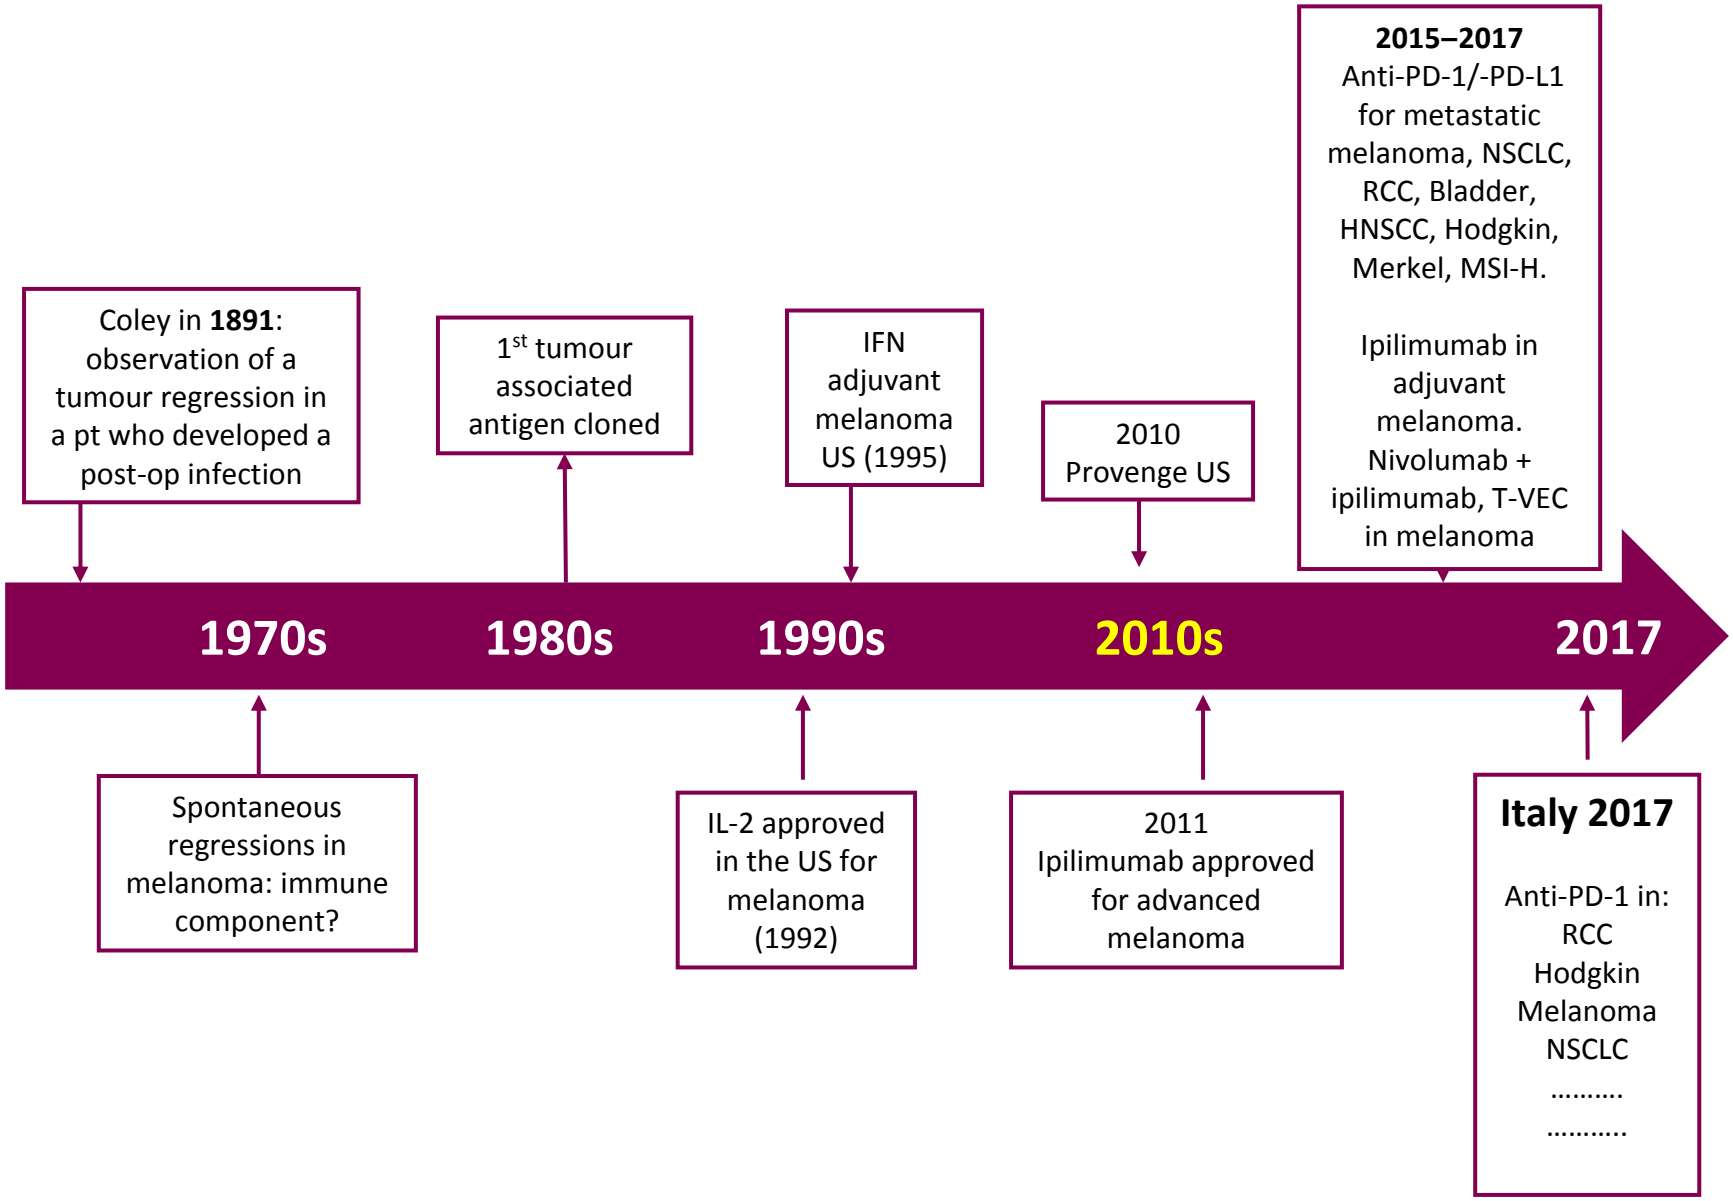
# Clinical Benefit of Pembrolizumab Treatment According to Mismatch-Repair Status



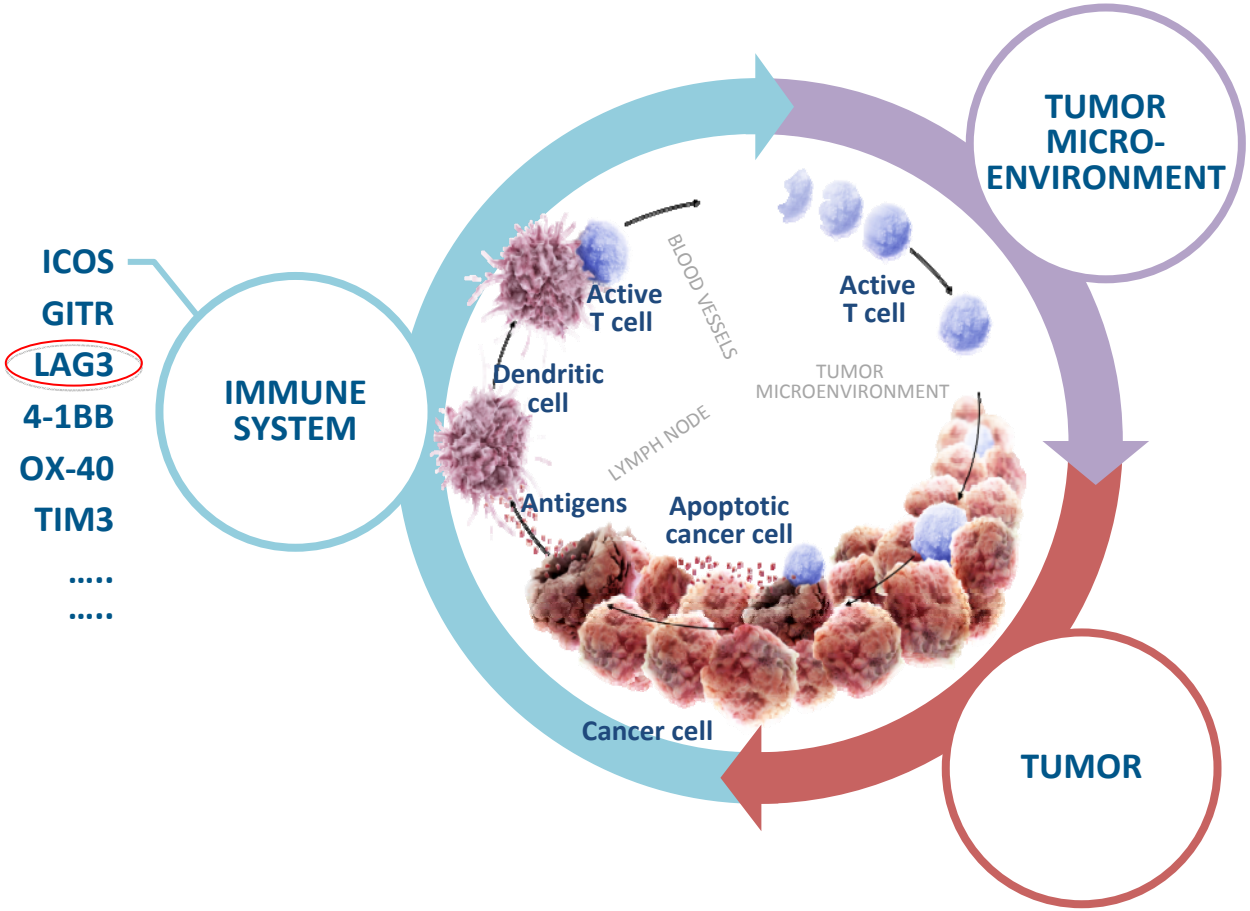
Le DT et al. N Engl J Med 2015; 372:2509-2520.

# A historical view of immunotherapy…

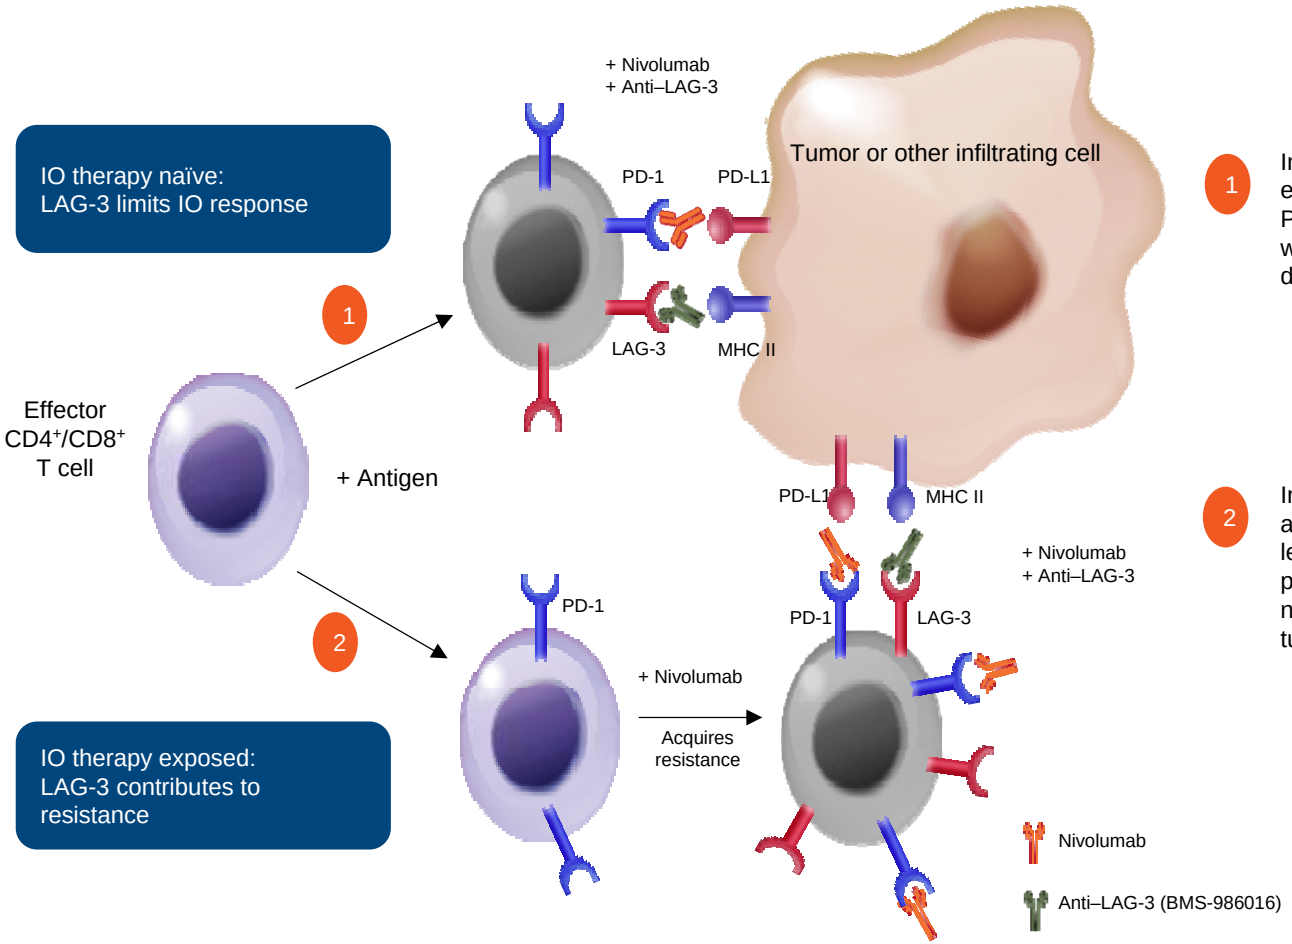


# The future of Cancer Immunotherapy

## Targeting and modulating multiple compartments



# LAG-3 in T-Cell exhaustion and anti–PD-1 resistance



1 In therapy-naïve patients, constitutive LAG-3 expression may limit the antitumor activity of PD-1 pathway blockade. Anti–LAG-3 combined with nivolumab may deepen or increase the durability of responses

2 In patients exposed to PD-1 pathway blockade, adaptive upregulation of LAG-3 expression may lead to treatment resistance and tumor progression. Anti–LAG-3 combined with nivolumab may restore T-cell activation and tumor response

# Anti-Lymphocyte Activation Gene-3 (anti–LAG-3; BMS-986016) in Combination With Nivolumab in Patients With Melanoma Previously Treated With Anti–PD-1/PD-L1

## Study design and endpoints

**BMS-986016 + Nivolumab (N = 212)**

**Dose-Escalation Phase**
(advanced solid tumors)

**Dose-Expansion Phase**
**Melanoma After Prior IO (n = 55)**
(other tumor-specific cohorts)

**Endpoints (dose expansion)**

- Preliminary efficacy[a] (co-primary)
- Safety/tolerability[b] (co-primary)
- Pharmacokinetics and pharmacodynamics
- Immunogenicity and QTc (secondary)
- Biomarkers (LAG-3 and PD-L1; exploratory)[c]

[a]Tumor response evaluated per Response Evaluation Criteria in Solid Tumors (RECIST) v1.1[10] (investigator assessment). [b]Safety evaluated per Common Terminology Criteria for Adverse Events v4.0[11] during treatment and up to 135 days after discontinuation. [c]LAG-3 and PD-L1 expression (percent of positive cells within invasive margin, tumor, and stroma) evaluated using immunohistochemistry (IHC) assays on formalin-fixed, paraffin-embedded tumor sections. Immune cell LAG-3 expression (≥ 1% or < 1%) determined using mouse antibody clone 17B4; tumor cell PD-L1 expression (≥ 1% or < 1%) determined using Dako PD-L1 IHC 28-8 kit.

Ascierto P et al., ASCO 2017

# Results

## Efficacy in the Melanoma Prior–IO Cohort

**Table 4. Preliminary evidence of antitumor activity**

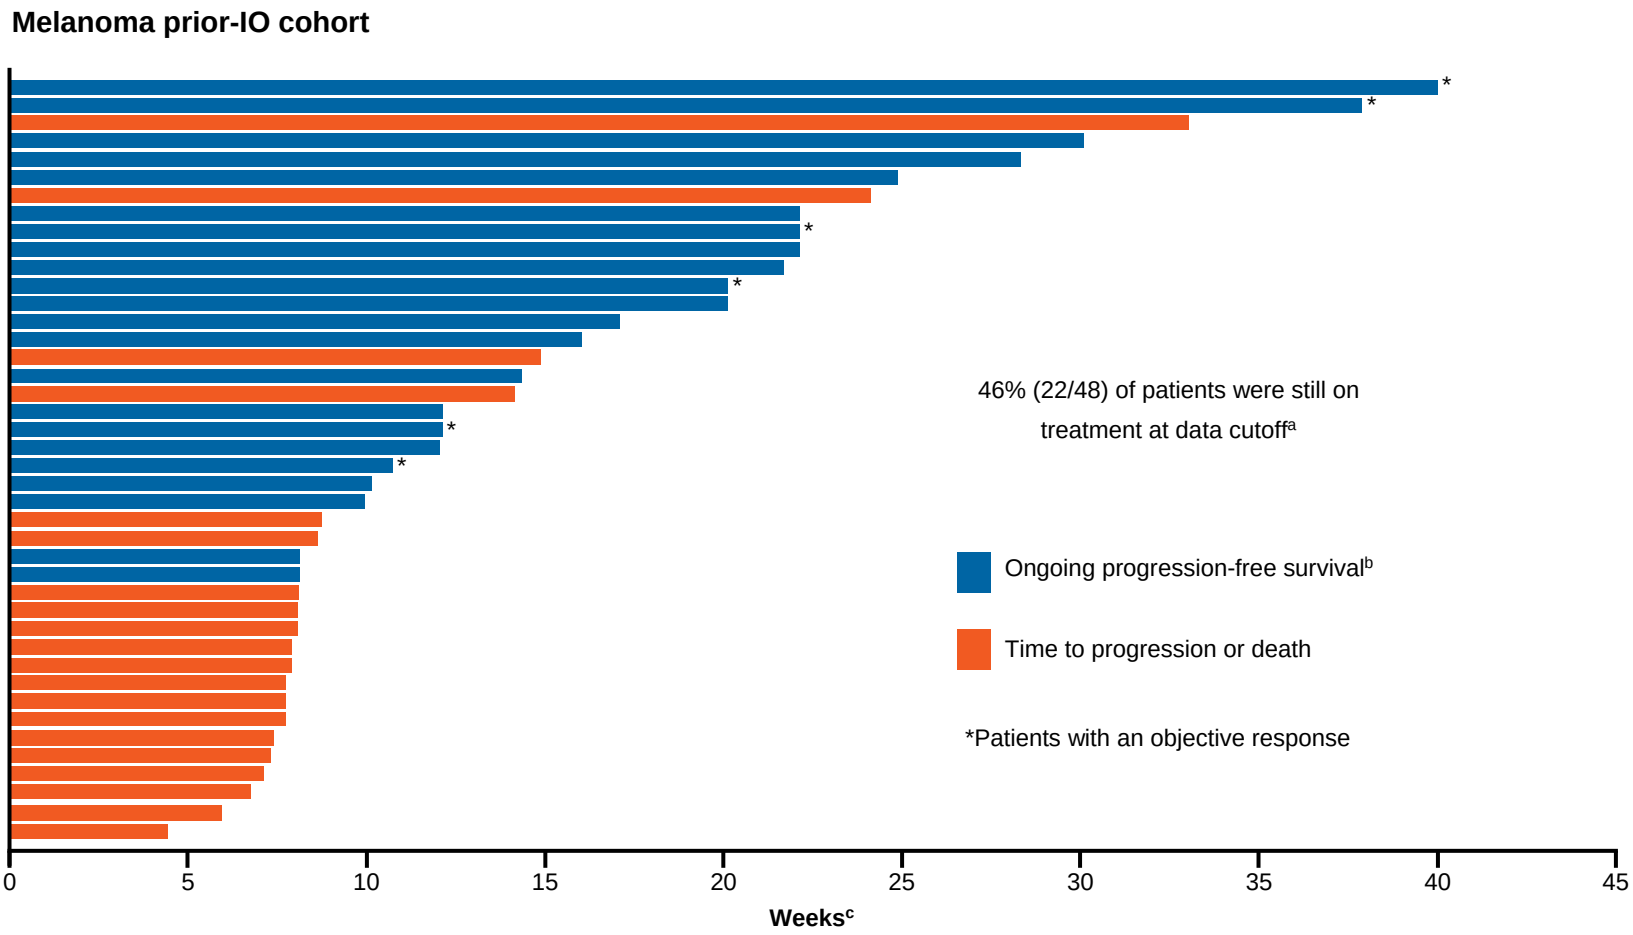
| Patients, n (%) | Mel Prior IO (n = 48[a]) |
|---|---|
| **BOR** | |
| CR | 0 |
| PR[b] | 6 (13) |
| SD | 20 (42) |
| PD | 16 (33) |
| Clinical progressions[c] | 6 (13) |
| **ORR**, 95% CI[b] | 6 (13), 4.7, 25 |
| LAG-3 ≥ 1% (n = 25) | 5 (20), 6.8, 41 |
| LAG-3 < 1% (n = 14) | 1 (7.1), 0.2, 34 |
| **DCR** (CR + PR + SD)[b] | 26 (54) |
| LAG-3 ≥ 1% (n = 25) | 16 (64) |
| LAG-3 < 1% (n = 14) | 5 (36) |

BOR, best overall response; DCR, disease control rate. [a]All response-evaluable patients; all progressed on prior anti–PD-1/PD-L1 therapy. [b]Two responses were unconfirmed. [c]Occurred prior to first radiographic scan.

# Results

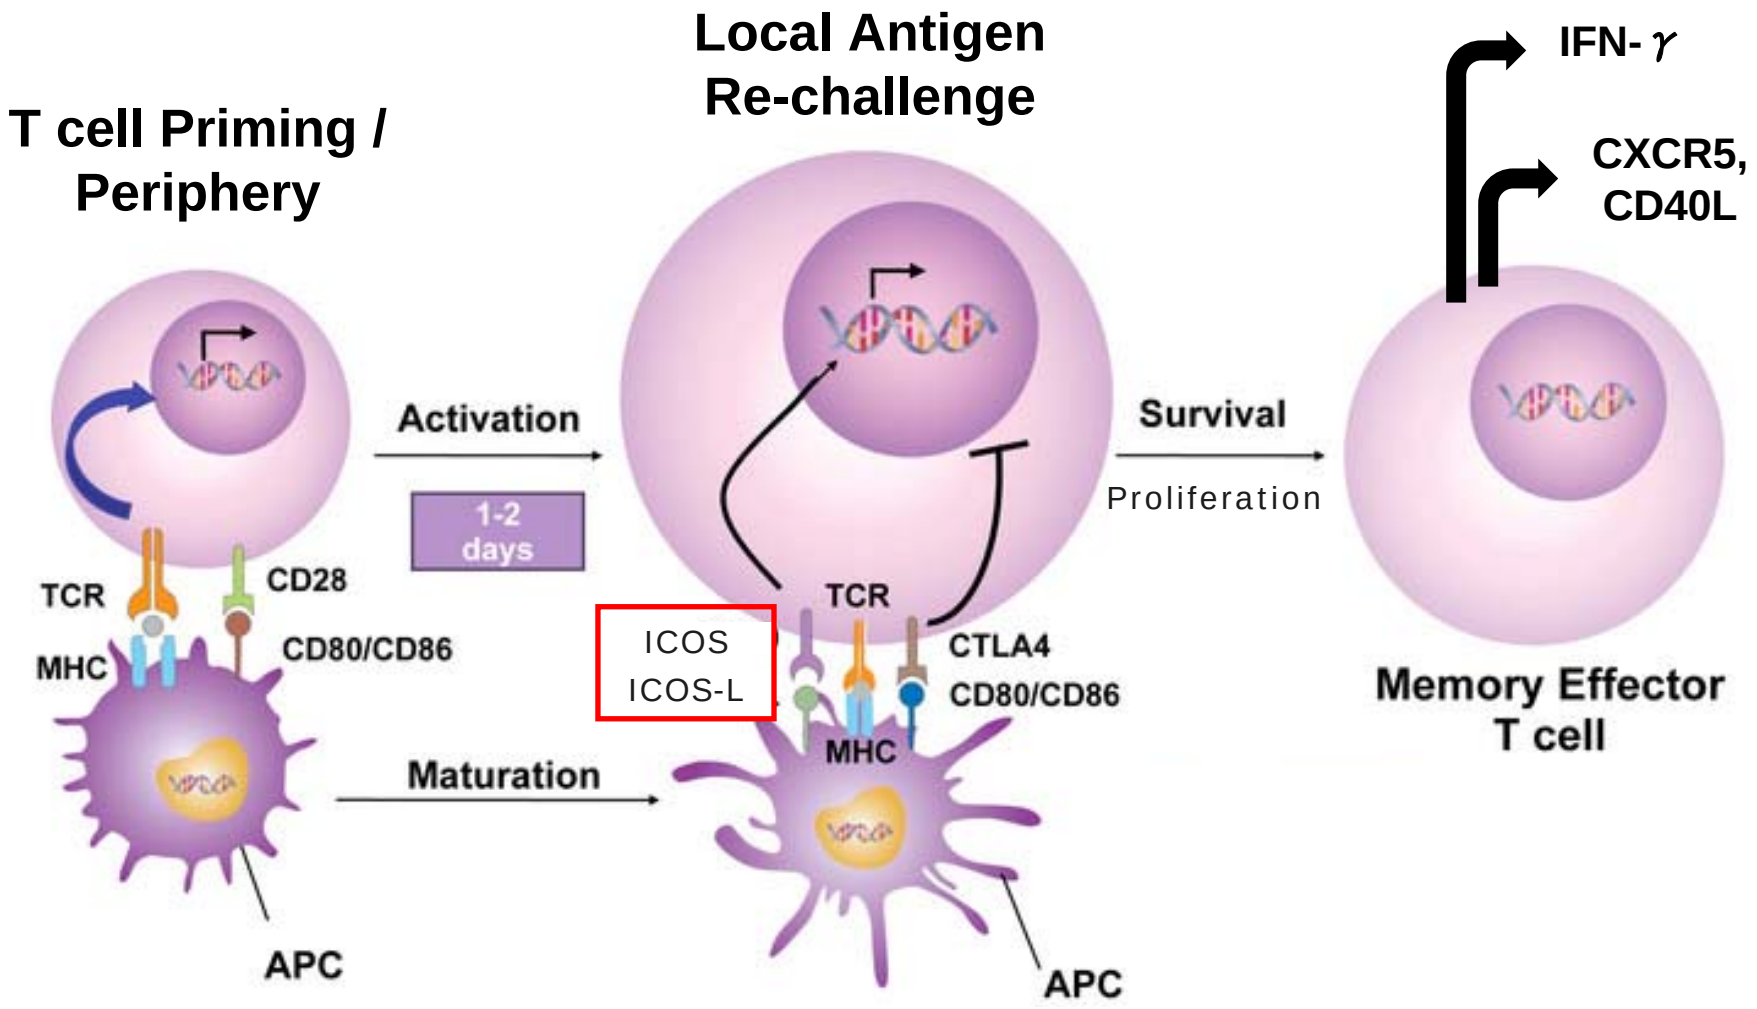
## Efficacy in the Melanoma Prior–IO Cohort

**Figure 5. Ongoing clinical follow-up**



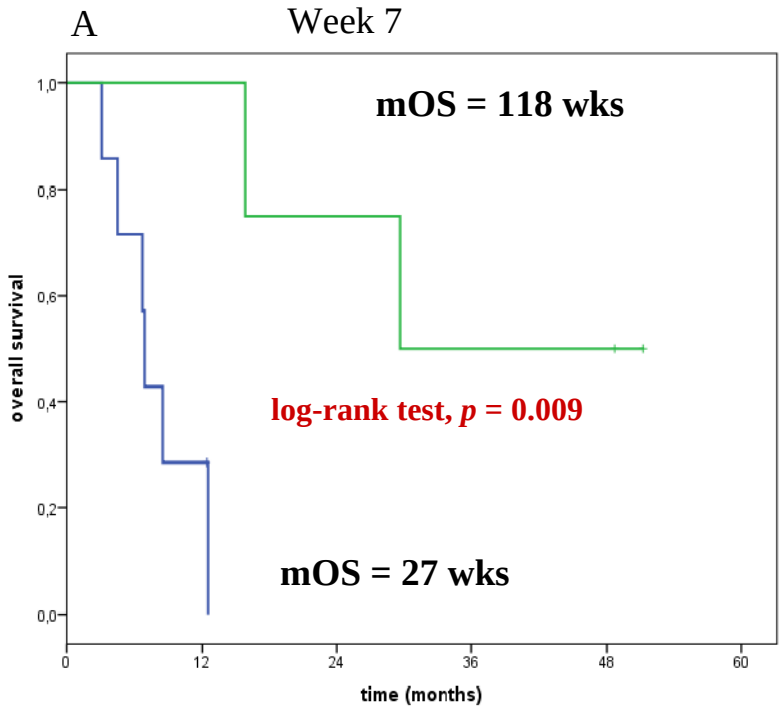
[a]Six patients had clinical progression prior to their first scan and are not included in the plot. [b]Censored on last visit. [c]Evaluations are planned for every 8 weeks.

# ICOS Mechanism of Action



# Activation status of T cells

- Increased levels of CD4+ICOS+ T cells in patients with different tumor types treated with Ipilimumab



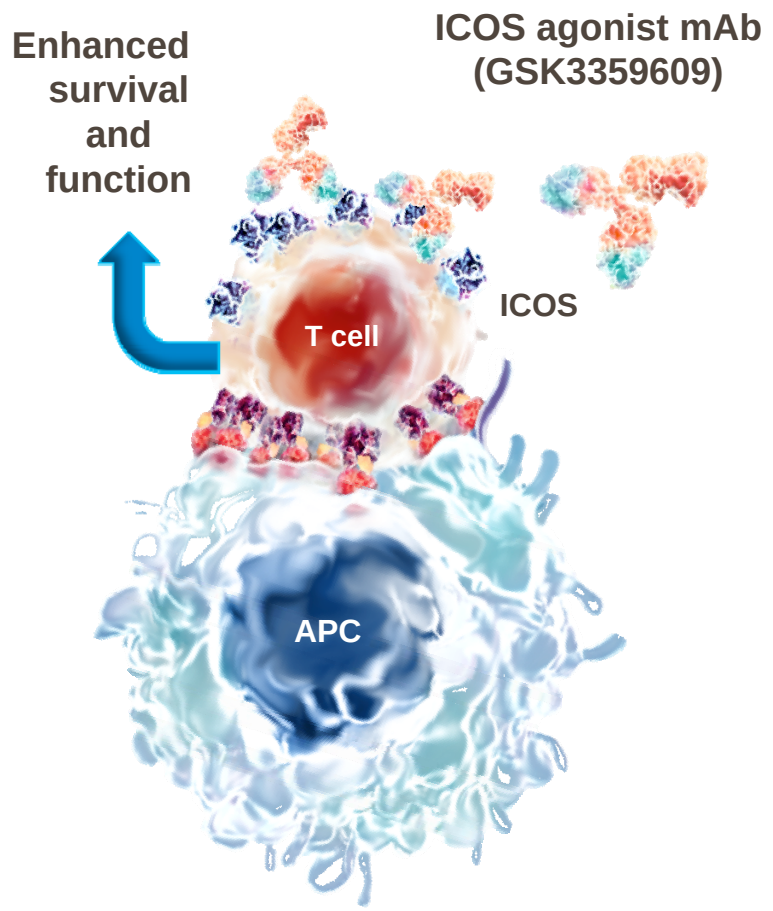
CD4+ICOS+ > 4 fold increase; CD4+ICOS+ ≤ 4 fold increase

Kaplan Meyer curves of overall survival according to the circulating CD4+ICOS+ in A) metastatic melanoma pts treated with ipilimumab at 10mg/Kg within an EAP

Di Giacomo et al CII, 2013

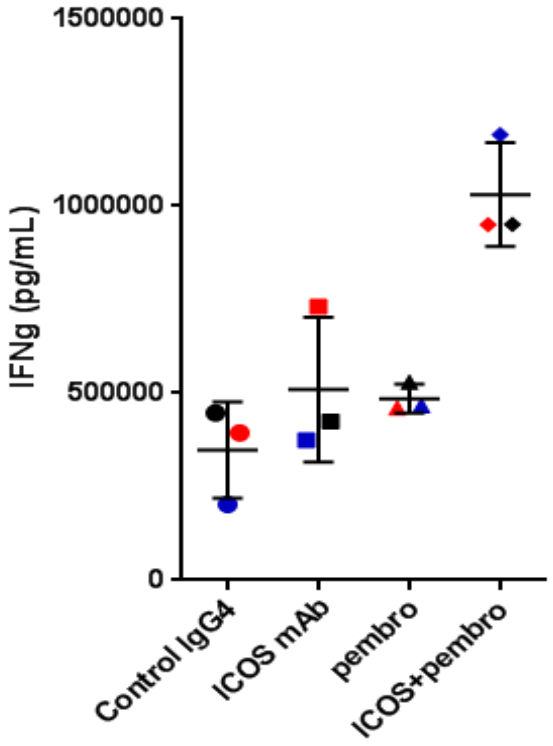
# Summary of GSK anti-ICOS agonist antibody GSK3359609

- A humanized, engineered IgG4 anti-ICOS agonist monoclonal antibody (mAb)
- For the treatment of cancer
- First-in-class ICOS agonist antibody in development
- Binds with high affinity to human ICOS
- Enhances the proliferation, survival and function of antigen activated effector T cells
- Well tolerated safety profile in pre-clinical studies
- Strong rationale for combination with other anticancer agents



# Preclinical Evidence of ICOS Agonist Combination Potential

**Combination of GSK3359609 with Pembrolizumab in human PBMCs induces synergistic IFN-$\gamma$ production**



**Synergistic combination of surrogate ICOS agonist antibody with checkpoint mAbs in mouse tumor models**

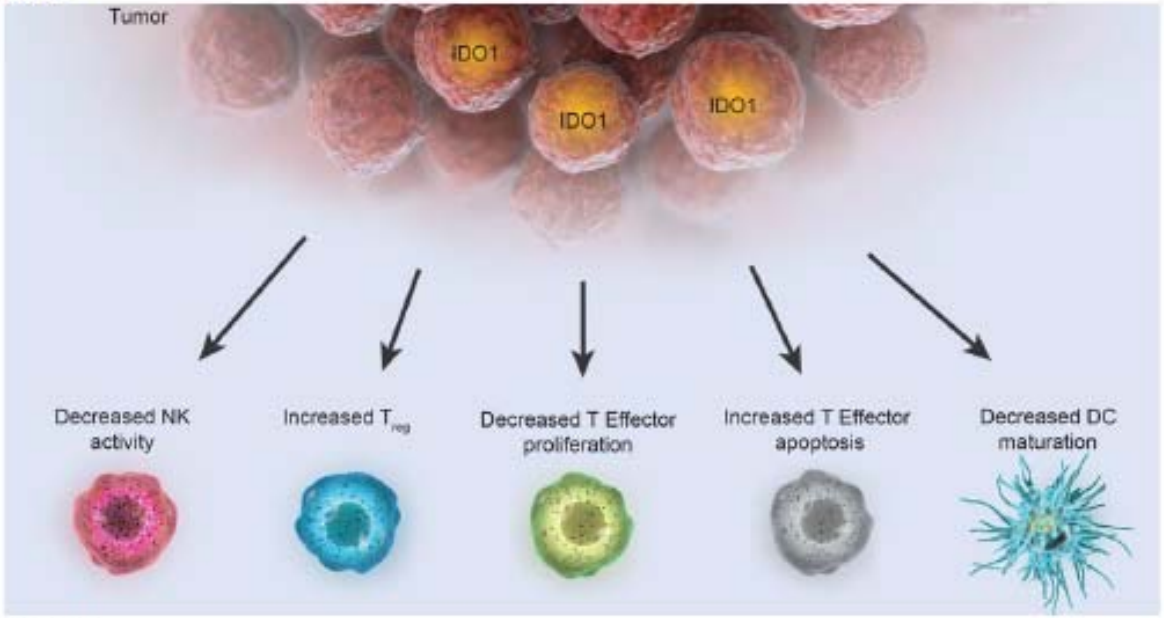
# IDO-mediated immunesuppression

- IDO1 is a tryptophan-catabolizing enzyme that is overexpressed in many cancers[1-3] and induces immune tolerance by suppressing T-cell responses[4]
  - IDO1 is expressed in human tumors and in dendritic cells within tumor draining lymph nodes[5]
  - IDO1 expression is associated with more rapid tumor progression and reduced survival[5]
  - IDO1 inhibition exhibits antitumor activity through the reactivation of effector T cells[3] and is synergistic with PD-1 blockade[6]



IDO1, indoleamine 2,3 dioxygenase 1.
